

CLAIMS

What I claim as my invention is:

1. A flat and flexible one and a quarter inch wide, 360 degree rubberized hair clogger stopper with an open center, that surrounds and covers the circumference of drains entrances to prevent hair and other debris from entering and clogging drain systems in a bathroom environment.
2. The hair clogger stopper is comprised of a 100 percent rubber material that rests flush and firmly against any bathroom utility, such as a sink, bathtub, or shower. This device will not cause any harm to the person using the device or bathroom utility.
3. The base of the hair clogger stopper is a circular surface that serves as a resting place for the trapping posts. The posts are U-shaped and will serve as a barrier or trapper that will collect hair and debris from the waste water. These posts are numerous enough and off-set into three separate rows that will serve as the defense mechanism to trap the hair and debris before it attempts to enter a drain passage.
4. The removal and installation of this invention is quite simple due to the rubber suction cups located underneath the stopper.
5. The hair clogger stopper may be designated for any size bathroom utility using a stopper or strainer that rests inside a drain entrance.
